

If unrecognized modules

It may be that when you connect your module (other than GPS2 or GPS4), it is not recognized by your PROIIIevo. No panic, your PROIIIevo works normally, it is likely that it does not simply detect the connected unit.

WHY ? We are a company in continuous development, this is, in our field, absolutely necessary. That means that your module has obviously been produced in a newer version of firmware than your PROIIIevo. That is why the firmware of your module is incompatible with the one of your PROIIIevo.

'DO IT YOURSELF' SOLUTION : it is, in this case, imperative to update your PROIIIevo with the latest firmware version available so that your module is recognized and functional.

How to update your PROIIIevo ?

- 1) Using the USB interface Art. A4220.

There are 2 ways, either :

- a. Connect it between your PROIIIevo and your Windows PC. Then use the « UPDATER » software + the latest firmware file available on our website.
- b. Connect it between your PROIIIevo and your « Android » tablet using an OTG adaptor. Then use the App « UPDATER PROIIIevo » available on Google Play.

- 2) Using a module GPS2 or GPS4.

Connect it with your PROIIIevo to be able to use the Bluetooth communication of this module. Warning ! Your PROIIIevo may perform an automatic update while connecting GPS2 or GPS4 module, that is normal ! Wait for end of this operation.

Then, there are 2 solutions, either :

- a. Use the App « UPDATER PROIIIevo » available on Google Play.
- b. Use your Windows PC provided with Bluetooth communication. Then use the « UPDATER » software + the latest firmware file available on our website.

Once finished, your PROIIIevo can recognize and operate your module.
